

## 508 Compliance Scorecard

### Problems:

#### Global:

1. No skip links
2. Nav is announced, but not populated with any navigational items

### Improvements:

1. If I search from home page I land on search results page, but screen reader lands on the very top of the page. Users do not know if results are found. User have to navigate all the way to results table to learn if anything found.

#### Home Page

2. Search all providers is an active tab, but not announced as active. After this tab it reads "Search by Provider Name" and only then goes to inputs, so it is easy to assume that I am searching by Provider Name.
3. Inputs are not wrapped in <fieldset>, hence they are not perceived as related.
4. "Search" and "Advanced Search" identified as "same page link". Since they are links, they are not identified as buttons, the do not come up in show all buttons list.
- 5.

#### Results page:

6. Star rating needs to be identified with text instead of star images. Need to hide images from screen reader.
7. The check box that allows me to select provider to be printed has "Add to Print List" label. It is not informative and I do not know which provider will be added.

### Bugs:

1. "Types of Child Care" paragraphs would stop reading mid-sentence and state "Clickable" ben nothing in there is clickable. Pressing "down arrow" allows to continue reading.

### Tester Comments 10/10/2016:

*-The initial testing that I have done was to just pick on very obvious issues using Chrome Wave plug in. It just highlights what might be wrong.*

*-At the moment I am testing with JAWS 16 screen reader in Chrome. It performs fairly well so far. I do not see major issues. There some that need to be improved, but it actually reads it, which is already good news. I will start fixing them now. I am planning to start with "Problems".*

### Tester Comments 10/11/2016:

*-Hi, I verified and improved keyboard navigation for keyboard only user. The improvement is in adding thickness and contrast for input /button elements that are on dark background.*

*-I was able to resolve some of the issues by getting read of <nav> tag that didn't have any navigational items in it.*

*-I added meaningful text for screen reader users for the star rating and print checkboxes.*

*On the home page, I wrapped search inputs into fieldset for a screen reader.*
